EXPERIENCE

Full Stack Developer

Glück Global Pvt Ltd

May 2026 – Present

- Integrated **LiveKit APIs** to deploy a **self-hosted live classroom platform** replacing Zoom; built camera, microphone, screen-sharing, and class-recording features capable of supporting 10 concurrent classes and **200+ simultaneous students**.
- Reduced student dashboard load time by **94% (52s to ~3s)** by eliminating a 23s BSON deserialization bottleneck, refactoring 100+ **\$or clauses** to a single **\$in index scan**, parallelizing queries via **Promise.all**, and shifting pagination to the server.
- Spearheaded a **full backend performance audit** across 100+ models; implemented **compound indexes** and Mongoose **.lean()** optimization on 70+ read queries, slashing memory usage by **60–80%** and cutting latency by **40–60%**.
- Engineered an **O(1) student lookup system** using hash maps and a 2-phase data hydration strategy, alongside building **interactive 2D games**, a dynamic exercise renderer, and **browser-locking security features**.

Software Developer

Flexzistay

Oct 2025 – Dec 2025

- Built **end-to-end price and availability management system** with Node.js APIs and responsive React interfaces for manager and admin portals; integrated **Cashfree payout gateway** with automated invoice generation using **event-driven Pub/Sub architecture**.
- Led **Cloudinary asset migration**, Next.js v15→v16 upgrade, and Tailwind v3→v4 migration with **zero downtime** while revamping UI across three portals.
- Integrated **Google Maps and MapTiler APIs** with Redis caching (2-week TTL), eliminating redundant location requests and **cutting API costs**.

Full Stack Developer

NxTechWorks

Jan 2025 – Sep 2025

- Engineered a **RAG microservice** (FastAPI + Gemma-3 + ChromaDB) with a responsive chat interface supporting **contextual document Q&A** with persistent conversation history.
- Built a **dynamic form builder** with JSON schema validation and drag-and-drop interface, and implemented **end-to-end appointment scheduling** with calendar APIs, conflict detection, and cross-device responsive UI.
- Architected a **JWT-based RBAC system**, reduced database load by 25% via **MongoDB aggregation pipeline** optimization, and cut **redundant API calls by 40%** through Redux state management across a multi-module dashboard.

PROJECTS

rum-core — Real User Monitoring (RUM) SaaS

[Live](#) | [GitHub](#)

Bun · Elysia · Hono · Cloudflare Workers · Next.js · Drizzle ORM · Neon · Turso · Upstash Redis · Docker

- Architected an **end-to-end RUM platform**: vanilla JS browser script (~ 5kb) monkey-patching fetch/XHR, capturing **web vitals** (LCP, FCP, CLS, INP) and request timing, batched and shipped to a **Cloudflare Worker ingest pipeline**.
- Designed a **pre-aggregation strategy** with 34 Turso tables (2 raw append-only + 32 rollup tables across hourly/daily cadences), keeping **dashboard reads exclusively on rollups** to avoid expensive aggregations on raw event data at query time.
- Built **geo/ISP enrichment at the edge** using Cloudflare’s native **request.cf** object - zero external API calls, zero latency cost - with **SHA-256 IP hashing** for privacy compliance.
- Engineered **multi-tenant project isolation** with origin validation and plan-based rate limiting, with a **GitHub Actions cron pipeline** handling hourly rollups, daily aggregation, and multi-stage cleanup across all 34 tables.

go-tunnel — Port-forwarding / HTTP tunnel tool

[Blog](#) | [GitHub](#)

Go · WebSockets

- Developed a self-hostable **HTTP tunneling engine in Go** (similar to ngrok) that securely exposes firewalled local development services to the public internet via a public server.
- Designed a **bidirectional proxy architecture** using **WebSockets** as the transport layer, engineering custom JSON serialization pipelines to stream and reconstruct HTTP payloads losslessly.
- Implemented robust network security and fault-tolerance, including **shared-secret handshake authentication**, automated client-side reconnect logic, and standard gateway error state handling (502/504/409).

LEADERSHIP & ACHIEVEMENTS

Technical Lead · College Internal Hackathon (*Team: Chivalry of Programmers*)

Flask · React · Open AI API

- Led a team of 5 to build an **AI-based Text and Audio Sentiment Analysis tool** within a **4-hour window**, integrating **Google Cloud Speech-to-Text** and **OpenAI GPT-3.5 Turbo** for emotional and sentiment analysis.
- Delivered a **functional MVP** ready for live demonstration, owning the full technical roadmap **end-to-end**.

SKILLS

Languages	TypeScript, JavaScript, Python, Go
Frontend	React.js, Next.js, Redux, Zustand, Tailwind CSS, Shadcn, Framer Motion, Material-UI
Backend	Node.js, Express.js, FastAPI, Bun, Elysia, Hono, Chi Router, REST APIs, WebSocket
Databases	MongoDB, PostgreSQL, Turso, Redis, SQLite, MySQL
Tools	Git, Docker, Cloudflare, Vercel, Cloudinary, Postman, Prisma, Drizzle ORM, Bun

EDUCATION

Bachelor of Computer Applications (BCA)	2022 – 2025
Dr. C.V. Raman University	
CGPA: 8.29
